-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *8/18/2006*.

2a)☒ This action is **FINAL**. 2b)☐ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1-20* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1,2,9-14,and 18-20* is/are rejected.

7)☒ Claim(s) *3-8 and 15-17* is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☐ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☐ Information Disclosure Statement(s) (PTO/SB/08) Paper No(s)/Mail Date _____.
4) ☐ Interview Summary (PTO-413) Paper No(s)/Mail Date. _____.
5) ☐ Notice of Informal Patent Application
6) ☐ Other: _____.

DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

> A person shall be entitled to a patent unless -
>
> (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1,2,11-14,18, and 19 are rejected under 35 U.S.C. 102(b) as being anticipated by Furukawa et al., Japanese Patent No. JP 4-201793 (translated).

With regard to claims 1,2,11-14,18, and 19, Furukawa et al. discloses a transporter for transporting a load over a surface (Figure 23 from JP 4-201793), the transporter comprising: a support platform [frame] (102) for supporting the load, the support platform (102) characterized by a fore-aft axis and a lateral axis; at least one ground-contacting element [wheels (100a) and (100b)] coupled to the support platform (102) in such a manner that the orientation of the support platform (102) with respect to the surface beneath [ground] and in contact with the at least one ground-contacting elements [wheels (100a) and (100b)] is capable of variation [the wheels (100a) and (100b) appear to be flexibly coupled to DC servo motors (104a) and

(104b) in a free rotational manner that enables fore-aft pivot, by means of two shafts or axles *that transmit driving torque from each motor to the wheels*, thus the platform is able to change attitude in the fore-aft axis from pivoting and thus capable of variation based on the position of a center of mass on the support platform (102)], and a motorized drive arrangement [servo motors (104a) and (104b)] for driving the at least one ground-contacting elements [wheels (100a) and (100b)]. Additionally, Furukawa et al. discloses a sensor module for generating a signal that characterizes the attitude of the support platform (102) and a controller for commanding the motorized drive arrangement to apply a torque to one or more of the ground-contacting elements [wheels (100a) and (100b)] as a function of the attitude of the support platform (102) based upon the signal generated by the sensor module. The placement of sensor module and controller are discussed in the translated JP 4-201793 specification on page 9, lines 2-4: "A box (110) is placed at a suitable position on the frame [platform] (102) and a tilting sensor and a control unit (neither of which is shown in the figure) are accommodated inside this." Since Figure 23 is one of four practical embodiments of Furukawa's invention and Furukawa et al. discusses the sensor module operation and controller that could be used *in all embodiments*, the sensor

module and controller discussed in detail *does indeed* apply to Figure 23, even though they may only be shown in other embodiments because the specification states that Figure 23 "indicates the fourth practical embodiment of the present invention" (page 8, last paragraph) and as discussed, *does* contain a sensor module and controller.

Pages 4 and 5 discuss the sensor module and controller in more detail, shown in Figures 5-7. Referring to the first practical embodiment, Figure 1, "In addition, a box (40) is placed at an appropriate position on the frame (12) and it accommodates a tilting sensor (42) which detects the tilting relative to the z shaft inside plane surface x-z as well as the tilting speed and a control unit (44) which inputs the output for that." (page 4, lines 3-7). The controller [unit] (44) (Figure 5) is interfaced with such elements as a joystick (46) [a user interface that generates a signal to vary the attitude of the support platform], a sensor module [tilting display device] (62) that is used to check or characterize the tilt orientation or attitude from the output signal generated by a tilt angle sensor (42) that measures an angle, and a microcomputer (48) that is used to calculate drive control values. *Together, with other interfaced elements, the discussed elements of the controller [unit] (44) connects with DC servo*

motors and commands motion of the transporter in a fore-aft plane and even in a lateral plane [as is the case in Figure 1 where the ground contacting element is a sphere]. Figures 6-7 illustrate flow charts of the subroutines of the controller [unit] (44). Ultimately, the motor torque instruction value is calculated by the controller [unit] (44) and the equations (shown on page 5) are given, which take into consideration tilting angles θx and θy, thus the controller [unit] (44) ultimately commands the motorized drive arrangement [servo motors] to apply a torque to one or more of the ground-contacting elements [wheels] (100a and 100b) *as a function of the attitude of the support platform* (102) based at least in part from the signal generated by tilt angle sensor (42) characterized by the sensor module [tilting display device] (62).

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 9,10, and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Furukawa et al., Japanese Patent No. JP 4-201793 (translated) in view of Sugasawa, U.S. Patent No. 4,749,210.

With regard to claims 9,10, and 20, Furukawa et al. discloses what is discussed above, but fails to disclose: a transporter wherein the attitude of the support platform is capable of variation based at least on a signal generated by a remote control device; the transporter further including a powered strut coupled to a platform, the powered strut capable of varying the attitude of the support platform based at least on the signal generated by the remote control device; and a method (including the limitations of claim 14) further comprising the attitude of the support platform based at least on a signal generated by a remote control device. *Sugasawa, however,* discloses a transporter [vehicle] having a first component [axle] that remains in a substantially fixed vertical position relative to the surface, wherein an at least one distance sensor (202) senses the distance [relative displacement] between a fiducial point on the platform [vehicle body] and the first component [axle], (column 8, lines 48-62), and wherein the attitude [body roll] [body roll is defined as the *leaning or tipping* of a vehicle's body to one side or the

other when turning or maneuvering, *thus is attitude*] of the support platform [vehicle body] is capable of variation based at least on a signal generated by a remote control device (170) [mode selector, which remotely controls the suspension characteristics, such as body roll], (column 27, lines 50-60) and the vehicle including a powered strut (10) coupled to the platform [vehicle body], the powered strut (10) capable of varying the attitude of the support platform [vehicle body], based at least on the signal generated by the remote control device [mode selector] (170), to provide a suspension control system that allows adjustment of suspension characteristics or suspension control characteristics [i.e. body roll] to more precisely fit the individual driver's feeling or comfort level. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the transporter disclosed in JP 4-201793 to include a first component that remains in a substantially fixed vertical position relative to the surface, wherein an at least one distance sensor senses the distance between a fiducial point on the platform and the first component, and wherein the attitude of the support platform is capable of variation based at least on a signal generated by a remote control device, the vehicle including a powered strut coupled to the platform, the powered

strut capable of varying the attitude of the support platform based at least on the signal generated by the remote control device, as taught by Sugasawa, to provide a suspension control system that allows adjustment of suspension characteristics or suspension control characteristics *to more precisely fit the individual driver's feeling or comfort level*.

Allowable Subject Matter

3. Claims 3-8 and 15-17 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Response to Arguments

4. Applicant's arguments filed 8/18/2006 have been fully considered by the examiner.

With regard to amended claim 1, the phrase "the attitude orientation", which was previously considered ambiguous claim language, has been amended to read "the orientation". The claim language of claim 1 is now considered distinct, thus *removing the previous claim objection*.

With regard to claims 3 and 15, previously rejected under 35 U.S.C. 102(b), the applicant argued that Furukawa (JP 4-201793) fails to suggest a sensor module that includes at least one distance sensor for measuring a distance characteristic of

the attitude of the platform. Due to Furukawa not distinctly stating or illustrating that a distance is measured and factored into sensing the angle of the frame [via tilt angle sensor (42)] relative to the surface beneath the transporter, *the examiner has found the argument persuasive*, thus removing the 35 U.S.C. 102(b) rejections of claims 3 and 15. As a result, claims 3,15, and any claims further dependent upon claims 3 and 15 are *now objected to*, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

With regard to claims 1 and 14, previously rejected under 35 U.S.C. 102(b), the applicant argued that Furukawa (JP 4-201793) fails to teach or suggest that the transporter provides a torque to one or more of the ground contacting elements as a function of attitude. The examiner respectfully disagrees, and the position has not changed, as discussed above in the 35 U.S.C. 102(b) rejections. More specifically, and reiterating what is discussed above, the motor torque instruction value is calculated by the controller [unit] (44) and the equations (shown on page 5) are given, which take into consideration **tilting angles θx and θy, (which are related to the orientation of the frame or platform)**, thus the controller [unit] (44) ultimately **commands the motorized drive arrangement** [servo

motors] **to apply a torque to one or more of the ground-contacting elements [wheels (100a) and (100b)]** *as a function of the (orientation) attitude of the support platform* (102) based at least in part from the signal generated by tilt angle sensor (42) characterized by the sensor module [tilting display device] (62). Therefore, since the tilt angle sensor (42) relates to the angle of the platform, the controller (44) considers tilting angles θx and θy input from the tilt angle sensor, and the controller drives the DC servo motors, the *broad* claim limitations of claims 1 and 14 "*a controller for commanding the motorized drive arrangement to apply a torque to one or more of the ground-contacting elements as a function of the attitude of the support platform based upon the signal generated by the sensor module*" and "*commanding the motorized drive arrangement to apply a torque to one or more of the ground-contacting elements as a function of the attitude based upon the signal*" do not overcome the teachings of Furukawa (JP 4-201793), *thus the rejections under 35 U.S.C. 102(b) stand.*

Since independent claims 1 and 14 stand rejected, *claims 9,10, and 20 remain rejected under 35 U.S.C. 103(a), as discussed above.*

Conclusion

5. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Marc A. Scharich whose telephone number is (571) 272-3244. The examiner can normally be reached on M-F 8:30 a.m. - 5:00 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Lesley Morris can be reached on (571) 272-6651. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
